Key indicators

Single-crystal X-ray study

$T = 293\text{ K}$

Mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$

R factor = 0.045

w R factor = 0.124

Data-to-parameter ratio = 10.5

For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.

In the asymmetric unit of the title compound, $\text{C}_5\text{H}_7\text{N}_5\text{O}^{2+} \cdot 2\text{NO}_3^- \cdot 2\text{H}_2\text{O}$, the guanine base is diprotonated and cocrystallizes with two nitrate anions and two water molecules. The structure is a layered one, and in each layer all H atoms bonded to O and N atoms are involved in a two-dimensional hydrogen-bonding network. Short contacts are observed between parallel layers and ensure the cohesion of the crystals.

Comment

Guanine, a purine base, is a constituent of nucleotides and, as such, pairs with cytosine in the helical structure of DNA. A number of purine and pyrimidine analogs are effective metabolic inhibitors with useful chemotherapeutic activity (Roy-Burman, 1970; Balis, 1968; Hitchings & Elion, 1963). This kind of hydrogen bonding in hybrid compounds is present in the active sites of several biological systems; for example $\text{N}-\text{H} \cdots \text{O}$ hydrogen bonds between guanine rings and phosphate ions are involved in the active-site inhibitor-binding mechanism in the ternary complex of calf spleen purine nucleoside phosphorylase. It also provides a new starting point for the design of inhibitors of PNP for therapeutic and other applications (Luić *et al.*, 2001). The crystal structures of guanine picrate monohydrate and thioguanine picrate monohydrate (Bugg & Thewalt, 1975), and guaninium dichloride (Matković-Čalogović & Sanković, 1999) have been reported previously. The present work is part of a series of structural studies on hybrid compounds of organic bases and inorganic acids; other examples are *m*-carboxyphenylammonium nitrate (Benali-Cherif, Cherouana *et al.*, 2002), *p*-carboxyphenylammonium dihydrogenmonophosphate monohydrate (Benali-Cherif, Abouimrane *et al.*, 2002) and L-histidinium dinitrate (Benali-Cherif, Benguedouar *et al.*, 2002). We report here the structure of guaninium dinitrate dihydrate, (I).

The main purpose of the present study is to examine the hydrogen bonding engineered in the crystals obtained from the reaction of guanine and nitric acid in water. The imino groups of the pyrimidine and imidazolyl portions (N3 and N7, respectively) in guanine are protonated, and each resulting $\text{C}_5\text{H}_7\text{N}_5\text{O}^{2+}$ dication is surrounded by three nitrate anions and a water molecule (Fig. 2). The protonated N atoms are

involved in the strongest hydrogen bonds; atoms N3 and N7 are hydrogen bonded *via* intermolecular interactions to nitrate [N3—H3...O22 = 2.737 (2) Å] and water O atoms [N7—H7...O2W = 2.566 (2) Å]. The guanine base is doubly linked to a single nitrate anion *via* intermolecular hydrogen bonds [N1—H1...O21 = 2.8417 (19) Å and N2—H22...O23 = 2.884 (2) Å], while N9 atom of the imidazolyl ring is hydrogen bonded to a nitrate anion by an intermolecular interaction [N9—H9...O12 = 2.741 (2) Å]. We also observe close contacts between atoms C8 and O11 [C8—H8...O11 = 3.267 (2) Å]. Atom O1W of a water molecule plays an important role in the three-dimensional network of hydrogen bonding. In a single layer, atom O1W is bound to two nitrate anions [O1W—H12...O12 = 2.853 (2) Å and O1W—H11...O23 = 2.989 (2) Å] and to the second molecule of water [O2W—H23...O1W = 2.643 (2) Å]. In each layer, anions, cations and water molecules constitute a two-dimensional network of hydrogen bonding (Fig. 2). The crystal packing (Fig. 3) is established by the arrangement of parallel layers along the *b* axis. This packing is stabilized by short contacts, the strongest being observed between atoms C2 and O1W [C2...O1W = 3.070 (2) Å]. The torsion angles N9—C4—N3—C2 = 178.79 (15)° and N1—C6—C5—N7 = -176.71 (16)° show clearly that the purine base geometry is not affected by protonation of atoms N3 and N7, *i.e.* the imidazolyl and pyrimidine rings are coplanar.

Experimental

Guaninium dinitrate dihydrate was prepared from a solution of 1 mmol guanine and 2 mmol nitric acid in 10 ml water. Colorless crystals were formed upon slow evaporation of the solution over a period of two weeks.
